ENVIRONMENTAL AND ENERGY POLICY

PURPOSE AND OBJECTIVES

Swedavia owns, operates and develops airports and properties near these airports.
We strive to continuously improve our management systems to minimise our environmental impact and use resources in a sustainable manner. This is done primarily by reducing greenhouse gas emissions, minimising other atmospheric emissions and discharges to water, minimising the use of chemicals and the generation of waste, and continuously working to improve energy efficiency. For us, it is a given that we comply with environmental and energy statutes in effect as well as other appropriate national and international regulations and requirements. It is also a given that we ensure access to the information and resources needed to achieve our environmental and energy objectives and targets. We shall also work to limit aviation noise and emissions from air transport operations.

FUNDAMENTAL RULES

In order to achieve this, it requires that we work in accordance with the following fundamental rules:

- We ensure that environmental concern is integral to every part of operations and is taken into consideration in every decision.
- The most important environmental issue for the air transport and real estate sectors is their climate impact, and this must be given priority in decisions and activities.
- We shall continuously improve energy efficiency and manage our own operations as well as influence other companies and organisations that we interact with for the sustainable use of resources.
- We shall purchase energy-efficient products and services and promote construction that leads to better energy performance.
- All of Swedavia’s employees shall take part in our environmental and energy work.
- We shall assess and manage environmental risks and energy performance in a systematic manner.
- Swedavia shall take an active part in local, regional, national and international work in order to reduce the air transport industry’s negative impact on the environment and work for the sustainable development of airports.
